

Resolved Decisions Log

Adjudicated framework and placement questions, ADR-style. See open_decisions.md for unresolved questions. When an open decision is resolved, move its entry here as a dated ADR and update the relevant use_cases/*.yaml.

Framework-level

OD-1 — Use-case ordering vs. PAC bucket numbers

RESOLVED — see ADR-1, ADR-9 below.

OD-2 — Terminology conformance

RESOLVED — see ADR-2 below.

OD-3 — Framings section

RESOLVED — see ADR-3, ADR-8 below.

OD-4 — Ownership dimension

RESOLVED — see ADR-4 below.

Item-level placement

OD-5 — F1 Security gap analysis

RESOLVED — see ADR-5 below.

OD-6 — F3 "teach me ___" learning augmentation

RESOLVED — see ADR-6 below.

OD-7 — B5 Centralized AI support

RESOLVED — see ADR-7 below.

Resolved (ADR)

ADR-1 — Use-case ordering (2026-08-10, revised)

Decision: Reorder to: AI-solution-delivery(1) / Curriculum(2) / Workforce(3). **Rationale:** Places owned use-cases first; un-owned Workforce last highlights the ownership gap.

ADR-2 — Terminology (2026-08-10)

Decision: Keep repo terminology ("use-case," "AI solution delivery"). **Rationale:** Internal consistency; PAC-facing exports can translate as needed.

ADR-3 — Framings section (2026-08-10)

Decision: Keep Extend/Defend/Upend lenses and AI Competitive Flywheel internally; omit from exec-facing exports. **Rationale:** Useful for internal completeness; not relevant to PAC audience.

ADR-4 — Ownership dimension (2026-08-10)

Decision: Add ownership to use-case taxonomy. - AI solution delivery → **Strategic Insights** - Curriculum integration → **Academic Affairs** - Workforce development → **TBD** (*key decision needed*)

Rationale: Clarifies accountability; surfaces Workforce ownership gap as an open item.

ADR-5 — F1 Security gap analysis placement (2026-08-10)

Decision: Keep in Foundation (not Bucket 2). **Rationale:** PAC prose describes it as cross-cutting; Appendix A placement was inconsistent.

ADR-6 — F3 "Teach me ___" placement (2026-08-10)

Decision: Keep in Workforce development. **Rationale:** It's a training/learning tool, not a solution to build.

ADR-7 — B5 Centralized AI support placement (2026-08-10)

Decision: Move to AI solution delivery. **Rationale:** This is about building/delivering AI solutions, not workforce training. **Open question surfaced:** Central vs. distributed build teams—key strategic decision TBD. **Update:** Resolved by ADR-10 below (2026-08-11).

ADR-8 — Remove Framings category (2026-08-11)

Decision: Remove the Framings kind entirely (supersedes ADR-3's "keep internally"). **Rationale:** Categorization was moved from the raw-item level to the deduplicated (unique_items) level — every unique_items entry now belongs to exactly one category instead of spanning several. Every entry that previously included a framings-flavored raw item (the Extend/Defend/Upend framings and the "AI Competitive Flywheel" spokes) had that item as the minority member of a duplicate group whose majority belonged to a real use-case or Capabilities/Foundation category; adjudicating each entry to a single category left Framings with zero members. An empty category serves no purpose, so it was dropped rather than kept as a placeholder.

ADR-9 — Use-case ordering, second revision (2026-08-11)

Decision: Reorder to: Curriculum(1) / Workforce(2) / AI-solution-delivery(3) (supersedes ADR-1's AI-solution-delivery(1) / Curriculum(2) / Workforce(3)). **Rationale:** Balances two goals that ADR-1's ordering no longer served once categorization moved to the unique_items level: (1) readability — AI solution delivery became the longest item list in Part 3 of the generated doc, and having the longest list first pushed the shorter, easier-to-scan categories further down; (2) ADR-1's original ownership signal — keeping the still-unowned Workforce development (see OD-8 in open_decisions.md) out of the first position — is preserved by this ordering too, since Workforce sits in the middle, not first.

ADR-10 — Central vs. distributed build teams (2026-08-11)

Decision: Both. Stand up a central AI Solutions Delivery team to handle high-complexity use-cases, **and** invest in AI training & literacy to empower self-service on low-complexity ones. For medium-complexity work, consider an "AI partner" model — similar to MarCom's partner program — with skilled partners embedded in functional areas across the university. **Rationale:** Resolves the tension surfaced in ADR-7 (central vs. distributed) by matching operating model to use-case complexity rather than picking one model for everything: a central team can't scale to every request, pure self-service can't handle technically complex work, and an embedded-partner tier fills the middle ground — distributing skilled capacity into functional areas without losing central coordination entirely. **Open question surfaced:** How the AI partner tier would actually be staffed/trained, and how it interacts with the job roles in roadmap/ai_strategy_develop.md's AI Solution Delivery section — see OD-11 and OD-14 in open_decisions.md.
